CLICQUE

Two guides in one file

Part A. Make the online mode work, step by step, with a test for every step.
Part B. Turn the web game into a phone app, and rebuild it again after every update.

Tick each box as you go. Screen names in Supabase, Netlify, Apple and Google change from time to time. If a button is named a little differently, look for the closest match. Prices and store rules change, so check the official pages before paying.

Part A. Make online mode work

Online rooms need three pieces: the **game files** (Netlify), a **shared database** (Supabase) and, optionally, the **AI chat functions** (also Supabase). Netlify only hosts files. Supabase keeps rooms, votes and chat so two phones can see the same game.

A0. Before you start

- The latest **clicque-app.zip**, unzipped. The folder is called **app**. The game is the folder **app/www**.
- A free **Supabase** account (supabase.com) and a free **Netlify** account (netlify.com).
- A plain text editor (Notepad, TextEdit, VS Code).
- Optional for AI chat: Node.js (nodejs.org, LTS version) and an AI key (see the NVIDIA key checklist).

A1. Create the Supabase project

- In Supabase click **New project**. Give it a name, choose a database password (save it), pick the region closest to your players, create it.
- Wait until the project says it is ready (about 2 minutes).
- Open **Project Settings, API**. Keep this page open: you need the **Project URL** and the **anon public key** in step A5.

A2. Create the tables

- Click **SQL Editor**, then **New query**.
- Open **app/supabase/schema.sql** in your text editor, select everything, copy it, paste it into the query box.
- Click **Run**. You should see: *Success. No rows returned*.
- Open **Table Editor**. You should see two tables: **docs** and **dev_config**.

If you run the file twice you may see "already exists" messages. They are harmless.

A3. Turn on anonymous sign-in

- Open **Authentication, Providers** (sometimes **Sign In / Providers**).
- Switch **Anonymous sign-ins** ON and save. Without this nobody can join a room.

A4. Make sure live updates (realtime) are on

- The schema already adds the table to realtime. To double check, open **Database, Publications** and confirm the table **docs** is listed under **supabase_realtime**.
- If it is missing, run this in the SQL Editor:

```
alter publication supabase_realtime add table public.docs;
```

A5. Put your Supabase details in the game

- Open **app/www/config.js** in your text editor.
- Paste the **Project URL** and the **anon public key** between the quotes. Save the file.

```
window.CLICQUE_CONFIG={
  SUPABASE_URL:'https://abcdefgh.supabase.co',
  SUPABASE_ANON_KEY:'eyJhbGciOi...'
};
```

The anon key is meant to be public. Never paste a key that starts with **service_role** here.

A6. Put the game on Netlify

- Go to **app.netlify.com/drop**.
- Drag the whole **www** folder onto the page (the folder, not the zip).
- Netlify shows an address like https://your-site.netlify.app. Open it on your phone.
- Optional: **Site configuration, Change site name** to get a nicer address.

A7. Run "Check connection"

- In the game tap **Online**, then **Check connection**.
- Every line should have a green check. Each red cross explains how to fix it.

Line	If it fails
Server connection	config.js still has the placeholder text, or you opened an old copy of the game.
Connected and signed in	Anonymous sign-ins is off (A3), or the URL or key in config.js has a typo.
Can write / read / delete a document	The schema was not run (A2). Run schema.sql again and reload.
Live updates (realtime) work	Run the realtime command in A4 and make sure realtime is enabled for the project.
Function chat-ai / admin-config is deployed	Only needed for AI chat and the Developer screen. Deploy them (A8). Online rooms work without them.

A8. Optional: AI chat and the Developer screen

- In the unzipped app folder run these commands in a terminal (put **npx** in front of each if you did not install the Supabase tool):

```
supabase login
supabase link --project-ref YOUR-PROJECT-REF
supabase secrets set DEV_PASSCODE="your-long-passcode"
supabase functions deploy chat-ai
supabase functions deploy admin-config
```

- Put your AI key in with the Developer screen: open your game address followed by **#dev**, then Settings, Developer. Choose Claude, NVIDIA or Other (any OpenAI-compatible provider), enter the passcode, paste the key, Save, then Test.
- Without this step the game still works: characters use the built-in dialogue.

A9. Test with friends

- Send friends your Netlify address. The **Invite by text** button in a room does it for you.
- Host: **Online, Create a room**. Choose players, chat length (or no chat), room name, public or private. Check the estimated game length.

- Friends: **Online, Join a room**. Type part of the room name or the 5-letter code in the search box, then tap Join.
- Host taps **Start now**. Empty seats are filled by AI contestants.
- The host runs the game: keep the host phone open and awake the whole time.
- A player who refreshes taps **Online, Resume your game**.
- If the host closes the app, the others see a warning after about a minute and can leave.

A10. Common problems

What you see	Likely cause	What to do
"Real online rooms need an account..."	config.js has placeholders, or sign-in is off	Redo A3 and A5, upload www again
Room list is empty	Rooms older than 30 minutes in the lobby are hidden, or realtime is off	Create a fresh room; check A4
Friends cannot join	They opened an old file instead of your address	Give them the Netlify address
Changes do not show after an update	The old version is cached	Close the page or app completely, reopen it
Characters sound plain	AI function not deployed, no key, or AI conversations switched off	Redo A8, check Settings

A11. Updating later

- Unzip the new **clicque-app.zip**.
- Copy your own **config.js** over the new one in www (so your Supabase details stay).
- On Netlify open your site, **Deploys**, and drag the new **www** folder onto it.
- If the update says the database changed, run the new SQL it mentions in the SQL Editor.

Part B. Turn the web game into an app (and again after updates)

There are three levels. Start with level 1 today. Move to level 2 when you want the app stores.

Level	What it is	Time	Cost
1. Install the web app	The Netlify address added to the home screen. Full screen, own icon, solo works offline.	2 minutes	Free
2. Real phone apps	The same game wrapped with Capacitor and published in the App Store and Google Play.	A few weekends	Apple about 99 per year, Google about 25 once
3. Rebuild after updates	Replace the game files, sync, build, upload the new version.	About 30 minutes each time	Free

B1. Level 1: install the web app

- Finish Part A step A6 so you have a Netlify address.
- **iPhone:** open the address in Safari, tap Share, then **Add to Home Screen**.
- **Android:** open it in Chrome, tap the menu, then **Install app** (or Add to Home screen).
- Open it from the home screen. It runs full screen like an app.

B2. Level 2: what you need first

- **Node.js** (LTS) installed on your computer.
- For iPhone: a **Mac with Xcode** (free), and an **Apple Developer Program** membership. No Mac? Use a cloud build service.
- For Android: **Android Studio** (free) and a **Google Play Console** account.
- Open **app/capacitor.config.json** and change **appId** to your own, for example com.yourname.clicque. Do this before the commands below. It cannot be changed easily later.

B3. Level 2: build the apps

```
cd app
npm install
npm run vendor
npx cap add ios        # Mac with Xcode only
npx cap add android
npx @capacitor/assets generate --iconBackgroundColor "#6a4cf0"
npm run ios            # opens Xcode
npm run android        # opens Android Studio
```

- In Xcode or Android Studio press **Run** with a real phone connected. Test: camera for the avatar photo, text invites, online room, rotating the phone, poor network.
- Set the app name, version and build number in the project (CLICQUE, 1.0, build 1).

B4. Level 2: publish

- Publish the privacy policy and terms (templates in **app/legal**, have a lawyer check them) as web pages. Keep both links.
- Fill the store forms with **app/store/listing.md**: texts, keywords, age rating, privacy labels, screenshots.

- Because players chat with strangers, the stores check for: a word filter, report and block, terms the player accepts, and a contact address. The game has filter, report and block; add a terms screen before launch.
- Test first: **TestFlight** on iPhone, **closed testing** on Google Play (new accounts may need a minimum number of testers for a set number of days, so start early).
- Submit for review. Allow about a week the first time.

B5. Rebuild the app after every update (turn it into an app again)

Do this each time you receive a new **clicque-app.zip**.

- Unzip the new zip into a **new** folder.
- Copy these from your old project into the new one: **www/config.js** (your Supabase details), the **appId** in **capacitor.config.json**, and the **ios** and **android** folders if you created them.
- In the terminal, inside the new app folder:

```
npm install      # only needed if package.json changed
npm run sync     # copies www into the iPhone and Android projects
npm run ios      # or: npm run android
```

- Raise the version: iPhone build number up by 1 (Xcode, General), Android versionCode up by 1 (Android Studio, build.gradle).
- Build the release: Xcode Product, Archive, Distribute. Android Studio Build, Generate Signed Bundle (AAB).
- Upload to App Store Connect and Google Play Console, add the release notes (use **CHANGELOG.md**), submit.
- For the web version: drag the new **www** folder onto your Netlify site (Part A, A11).

B6. Keep these safe

- Your Supabase project password and keys, your **config.js**, your Apple and Google logins.
- The Android **signing key** (keystore file and its password). If you lose it you cannot update the app.
- A backup copy of each zip you shipped.

Tip: never share the file **supabase/private/seed-dev-config.sql**. It holds your AI key. Delete it after you have run it.
